Case study

OXYBABY® at Desiderio Sebastián - Campeón de España

Precision - from cutting to packaging - quality assurance for premium ham

The champion relies on the champion: Desiderio Sebastián, Campeón de España (Spanish champion) in ham carving, uses the OXYBABY® from WITT to monitor the protective atmosphere of his packaged premium products. The portable gas analyser delivers fast, accurate and reliable measurement results and, thanks to its ease of use and minimal requirement for measurement gas, is ideally suited to this application.

As a multi-award-winning master craftsman, Sebastián is synonymous with the utmost precision and uncompromising quality – not only in the cutting process, but throughout the entire finished product, including the packaging. With pre-cut products packaged in a protective atmosphere, he consistently applies his craftsmanship to the subsequent processing stages.

Verification of the gas composition plays a key role in this process, as it has a significant impact on freshness, quality and shelf life, whilst also needing to be efficiently integrated into the process.

The OXYBABY® enables fast, reliable spot-check analysis and delivers accurate results within seconds. Its one-handed operation with an integrated needle ensures particularly easy handling during ongoing production.

A key advantage is the small sample size requirement. As packaging for sliced ham often contains only a small volume of gas, many analysis systems reach their limits. However, the OXYBABY® enables precise and reproducible measurements even under these conditions.

In this way, the device helps Desiderio Sebastián to consistently meet his high-quality standards and ensure the precision of his craftsmanship right through to the packaged end product.
